

Company History

Proactive Engineering Consultants (PEC) is a Southern California based Civil Engineering Consulting firm specializing in serving the land development community and governmental entities throughout Southern California. PEC was founded in 2006. Principal, Tom Braun has operated in Southern California for over 30 years for both large and small multi-discipline consulting firms. A strong desire to provide focused and top-notch service to our clients prompted the firm's founding. After working at larger companies they found they, and most of the really talented engineers, were too far away from the hands-on work they loved. They had become more of "paper pushers" and damage control experts for when problems surfaced. At PEC they operate as hands-on principals.

Our goal is to do things right, and do them once. That is where our company name, "Proactive", came from. Proactive Engineering Consultants is a firm that is committed to providing outstanding service for our clients. To ensure this PEC only hires the most professional, capable people in the industry. We adhere to Pareto's Principle: "20% of the people do 80% of the work", and seek only to have the top performing professionals employed with us.

We can provide expertise in the following services: land planning, civil engineering, land surveying, construction management, program management, project management, development processing, Specific Plan and Environmental Impact Report support and preparation, development and re-development mapping. We provide all encompassing services from project inception and project management through construction and project completion.

Proactive Engineering Consultants provides GIS services as an ESRI authorized consultant with expertise in analyzing the spatial relationships of different data types, solving real-world problems then displaying the results in themed maps and reports or by providing the data for inclusion into other mapping systems.

... "20% of the people do 80% of the work" ...
